

# 5 STAGE DISTILLED WATER PURIFICATION SYSTEM

Distilled water is pure water, without any minerals or harmful bacteria. Water distillation is still one of the best ways to remove the contaminants from your drinking water, It removes over 95% of all chemicals and contaminants. Distilled water is cleaner than most of the other types of water resulted after different filtration processes.

This under the counter reverse osmosis system is one of the most complete systems available and provides safe, pure water using Reverse Osmosis Technology.

- It eliminates up to 90% of total dissolved solids, +99% of harmful contaminants in water such as bacteria, viruses, lead, radium, chlorine and arsenic
- With the RO system, you can trust that your drinking water is clean, it tastes and smells great and is clear and healthy
- System installs neatly under the sink and maintenance is easy.

## What Is Distilled Water Used For?

In the medical industry, this type of distilled water is called sterile water, which is slightly different. It is used to sterilize all instruments that come in contact with a human. Distilled water is preferred by dentists because their patients use it to rinse their mouths; and the dentists use it to wipe equipment.

For a similar reason, the cosmetic industry uses distilled water as well.
