

# Water PURIFIERS

Protect Your Family and Yourself from Waterborne Contaminants.

## What Can Water Purifiers Do?

It depends on whether you install a 3 or 5 phase filtration system.

A Three Phase Filtration system is a good system to have for preventing dirt and most smaller particles that might get in water supply through old pipes that are corroded, or cracked. It takes out all basic impurities like chlorine, sand, worms and rust.

### 3 Filter stages:

1. Polypropylene Filter: Removes sand, worms, leaves, etc.
2. Granule Activated Carbon Function: Removes chlorine, lead, lime, etc.
3. Activated Carbon Block: Improves taste and neutralizes any odours.

The 5 Phase system adds the additional filtration of a UV light filter which not only removes harmful bacteria and viruses, but destroy them, giving you the best water solution to be used with your beauty systems.

Protects against Toxins and Bacteria

### 5 Filter stages:

1. Micron Polypropylene Sediment filter: Removes sand, worms, leaves, etc.
2. Granule Activated Carbon Function: Removes chlorine, lead, lime, etc.
3. 1 Micron Activated Carbon Block: Removes Chemicals and impurities.
4. Post Inline Carbon filter: Improves taste, neutralizes any odours.
5. UV Light: Destroys more than 99% of bacteria and viruses in water.
